## Foreword

---

Since the start in 2003 of the war in Iraq, increasing numbers of Iraqi nationals have left their homes for different parts of Iraq or have taken residence in neighboring countries, particularly Jordan and Syria. This has led to increased international attention to the living conditions of the Iraqi community in the host countries.

Accordingly, and upon the request of the Government of Jordan, the Norwegian Research Institute Fafo was tasked to conduct a survey that would provide the Jordanian Government with an assessment that reflects the reality of the Iraqi community in Jordan and that will enable the government to address the needs of this community in the Kingdom.

The present study is a result of extensive collaboration and cooperation between the Norwegian Research Institute Fafo, Department of Statistics and the Jordanian government technical team, which undertook the task of facilitating the progress of the study, providing the technical team with all the necessary information and data needed for the conclusion of the study. The technical team was also tasked with reconciling the various and contradicting estimates of the size of the Iraqi community in Jordan.

The study was mainly funded by a generous contribution of the Norwegian Government through its Ministry of Foreign Affairs.

The United Nations Population Fund UNFPA also contributed to the funding, in addition to providing valuable input that played a significant role in concluding the study.

The Fafo team consisted of Kristin Dalen, Jon Pedersen, Akram Attallah and Marianne Dæhlen. Kristin Dalen and Jon Pedersen wrote the report.

# Iraqis in Jordan

## Executive Summary

---

Many conjectures have been put forward as to how many Iraqis there currently are in Jordan. While figures as high as one million or about 18 percent of the total population have been aired, this study concludes that there are between 450,000-500,000 Iraqi residents in Jordan as of May 2007.

The number is based on consideration of the immigration statistics, the number of phone subscribers as well as on a household survey of Iraqis and non-Iraqis carried out in May 2007 by the Norwegian Research Institute Fafo in cooperation with the Department of Statistics.

- The survey found that some key characteristics of the Iraqi households and individuals present in Jordan in May 2007 were that the migration of Iraqis to Jordan is predominantly a migration of families, seventy seven of which arrived in 2003 and later, with the highest volume of movement of population taking place in 2004 and 2005, according to the Jordanian border authorities.
- The survey showed that the vast majority were Sunni Muslims with sixty eight percent Iraqi community surveyed, seventeen percent were Shi'a Muslims, and twelve percent were Christian. It also showed that the majority of the Iraqi community in Jordan resides in Amman, and had originally come from Baghdad. This demographic ratio reflects the geographic pattern of violence and insecurity in Iraq, especially when one takes into account that the largest volume of Iraqi migration took place in 2005, according to the Jordanian border authorities.
- The survey also showed that Iraqis in Jordan are well educated and twenty two percent of Iraqi adults in Jordan work.
- The majority of Iraqis lives on savings or receives transfers; forty two percent receive such transfers from Iraq. This makes a large segment of Iraqis in Jordan at risk of becoming vulnerable with the depletion of savings, or deterioration in the

security situation in Iraq that may affect the transfers of funds that support a significant portion of the Iraqi community in Jordan.

- Within certain subgroups we find larger difference between the genders, but on average there are a small overweight of women in the Iraqi population in Jordan, this is particularly true for the middle aged part of the population (25-60).
- The Iraqi population is on average older than the Jordanian population, the mean age for Iraqis is 29.5 years whereas it is 24 for the Jordanians. The majority of the Iraqi population is 25 years of age and above (56 percent), 26 percent of the population is below 15 years of age and the remaining 18 percent are between 15 and 25 years of age.
- One in every five Iraqis has concrete plans to emigrate to a third country. A wish to go to a third country is found in all parts of the population, but it is particularly true for the poorer part and the ones that belong to non-Moslem religions.
- More than 95 percent of those that wish to return to Iraq say that they will not return to Iraq before the security situation allows for it. Plans to go back to Iraq are particularly seen among the Iraqi population with high levels of resources, economically and with concern to high education, among the Moslem population and among the ones that came in 2006 and 2007 (late arrivals).
- Close to 70 percent of the Iraqi population in Jordan is in working age (15+); of these, about 30 percent are participating in the work force. The participation rate is particularly low for women among whom only about 15 percent are actively participating in the labor market. The rate is substantially higher for men, but still only about every second Iraqi man in working age participate in the workforce.
- Of the Iraqis who have employment, about 60 percent work as employees for someone else, this is particularly true for the few Iraqi women who work; 70 percent of them are employed by someone else.
- About 30 percent of the Iraqi men who participate in the work force report that they are employers. About 25 percent of the economically active Iraqi women and 13 percent of men are self-employed.
- About 1 in 5 households are female headed; female headed households are more often found among poorer households and among households where the education of the household head is lower.
- Two of three Iraqi households have children under the age of 18 years as members. The average size of an Iraqi household in Jordan is 4.1 persons.

- 25 percent of the households own the dwelling where they are currently residing. The remaining 75 percent rent their dwelling. 60 percent of the households in the highest wealth group own their dwelling, whereas only 1 percent of the poor households do.
- The population of Iraqis in Jordan is almost exclusively urban and hence most of them benefit from the infrastructure in the capital city of Amman and other large cities. Almost all households are connected to the public electricity network, the water network and the sewage network.
- The survey shows that Iraqi households in Jordan are highly dependent on transfers as an income source. Close to half of all Iraqi households in Jordan are receiving transfers from inside Iraq. Other important income sources are employment, self employment and transfer incomes from a third country.
- The poorest households are more dependent on income from employment, whereas the more wealthy households have a higher dependency on income from self employment and on transfers from Iraq. The middle wealth groups are the ones that have the least income from employment and are hence the most dependent on transfers from outside the household.
- 25 percent of women aged 15-50 have given birth in Jordan during the last 5 years. Nearly all sought medical aid during pregnancy and gave birth with qualified assistance.

The large number of Iraqis in Jordan represents big challenges to Jordan in various sectors. The above mentioned characteristics reflect the situation as of May 2007. It is important to note that these characteristics will change over time with the continued crisis in Iraq.

## Introduction

---

The Iraqi war has led a large number of people to leave Iraq and take up residence abroad, and Jordan has received large numbers. Many estimates of the number of Iraqis in Jordan have been put forward and numbers as high as one million or 750,000 have generally been accepted.

Estimating the size of an immigrant population to a country is difficult. In the case of Iraqis, the situation is particularly difficult, as some may have entered without a legal permit, or overstayed their permit. Parts of the Iraqi population in Jordan may therefore be reluctant to reveal their presence. Accordingly any one estimate cannot rely on a single source, survey, or even the census, and needs to consider several sources of evidence.

## The number of Iraqis in Jordan

---

In estimation the number of Iraqis in Jordan, the Jordanian government's technical team had at their disposition data from the population and housing census of 2004; the number of arrivals and departures at Jordanian border posts; data on phone usage by Iraqi nationals as registered by the telecommunications companies; and a survey carried out by the Norwegian research Institute Fafo in cooperation with the central statistical agency of Jordan, the Department of Statistics (DoS). The sources provide divergent numbers and will be presented in turn.

In attempting to determine the estimate that reflects the number of Iraqis in Jordan, the need to balance between the major discrepancies in the figures from the sources mentioned above as well as overcome the shortcomings that all estimates have, required extensive desk research, in addition to the field surveys, to allow the study to fulfill its objectives.

The sample survey conducted by the Norwegian research Institute Fafo in cooperation with the Department of Statistics (DoS) estimated Iraqis at 161,000. The survey was based on interviews in nearly 1000 sample clusters and depended on Iraqis identifying themselves as Iraqi nationals. The comparatively low number may be a result of the fact that Iraqis may have been reluctant to reveal themselves to the Jordanian authorities. They may have feared deportation or other sanctions and therefore preferred not to identify themselves as Iraqis to the survey teams, but rather as Jordanians or other Arab nationalities.

Accordingly the technical team concluded that while the survey has managed to capture the main characteristics of the Iraqi community in Jordan, yet it may not have been able to provide an estimate for the number of Iraqis currently in Jordan on its own.

The Jordanian immigration authority has provided the numbers of Iraqi nationals entering and leaving Jordan since 1990 up to March 2007 estimating them at 547,000. An important weakness in the registration of immigrants and emigrants at the Jordanian borders are known to be that the registration is better for immigrants than for the emigrants. Thus,

people may be correctly registered when they are entering into Jordan, but not appropriately accounted for when they leave the country (for example, only the household head might be registered). The problem is especially large for some nationalities (for example Syrians), but due to the particular situation after the Iraq war the shortcomings of registration are believed to be less for Iraqis, especially after 2004.

Jordanian phone companies register the nationality of their phone subscribers. Data has been collected from all the companies operating in Jordan. This gives an estimate of the number of lines ascribed to Iraqis. All but three thousand are mobile numbers. Based on the information from the phone companies and the characteristics from the survey, an estimate of the number of Iraqis in Jordan can be deduced at 481,000.

The main problem with estimating Iraqis based on the number of active mobile numbers rests in the difficulty in differentiating between Iraqis on short visits on the one hand, and those who have been, or intend to stay, for longer periods of time in Jordan, on the other. Since the vast majority of Iraqis in Jordan view their stay in Jordan as temporary, and await immigration to a third country, or their return to Iraq, once circumstances allow, as will be demonstrated later in the report, it is difficult to determine the duration of a “short stay”, which may reflect intention rather than the reality that has significantly prolonged the stay of Iraqis in Jordan.

A second problem is that Iraqis who left during the three month period of registration of active numbers will be counted as resident, even though they were not at the reference date for the estimate of the number. For these reasons the estimate derived from the number of phone subscribers is likely to be somewhat unreliable.

## Conclusion

---

Given the major discrepancies in figures the Jordanian government’s technical team was tasked with reconciling the various and contradictory estimates of the size of the Iraqi community and has concluded that the number of Iraqis in Jordan is estimated at 450,000-500,000.

## Characteristics of Iraqis

---

The Iraqi households in Jordan and the individuals within them differ in their characteristics and resources. The following section will briefly present the main findings that describe the surveyed population both on household and individual level, these findings are based on the survey conducted by DOS and Fafo in May 2007. The text is followed by an appendix presenting the findings from the survey in tables.

The presentation focuses on issues that are important for the well-being of a population: demographic composition such as gender, age, religion, place of origin and ethnicity; personal resources such as education, skills, labor force participation, wealth and health. We will also look into the status of Iraqis in Jordan, for instance whether they have valid permits to stay, when they arrived, if they are registered with UNHCR and their plans for the future such as whether they plan to stay in the country or if they have plans to leave.

Personal resources are complemented with the living conditions in which Iraqi households are living their lives. In this brief report, we also consider the physical living conditions of Iraqi households in Jordan. We will describe what kind of dwellings they live in, their access to water and electricity and the means that Iraqi households have with concern to income sources and investments.

To some extent the characteristics and the resources of the household, and the individuals within it, are correlated and mutually affect each other.

For the purpose of this study an “Iraqi in Jordan” is a person of Iraqi nationality that during the survey period (May 2007) resided in Jordan, regardless of how and from where the person arrived into Jordan, and regardless of when the person arrived.

### Background variables

Analyses of household and individual characteristics are broken down on several background variables. Some of the background variables will differ between the different indicators and whether the analysis are done on individual or household level, but most indicators will be broken down by: age, gender, start of residence in Jordan, location of residence, religious affiliation and economic status of the household. In some of the tables the statuses of valid permits and the registration with UNHCR will be included as background variables.

Most of the background indicators are straightforward, but the economic status of households needs some further description. In the survey of Iraqis in Jordan we have collected information on the income of the households, but to use this as an indicator of household’s economic status is known to be problematic. The households estimation of own

income is often too low, this may come from the fact that people do not want to reveal their income for different reasons or they are not able to estimate the income of the household correctly.

In this particular survey we face an additional difficulty with using income as an indication of household's economic status in that Iraqis may be living from their savings due to the difficulties of being able to work in Jordan due to lack of work permits, and that households may be here on temporary bases and hence are living from savings. In addition to income, the survey also records durable goods in the possession of the household. Respondents report on their possession of 25 different durables. Household possessions are highly related to the wealth of a household and a wealth index was created to represent the wealth of each household using the information collected on possession of durables, this wealth index is a proxy for long-term economic status of a household. In the tables for both individuals and households we will hence use the wealth index as an indication of economic status of the household. The wealth index is divided into five quintiles, the first quintile contains the households with the lowest score on the wealth index and are the poorest, the fifth quintile are the household with the highest score on the wealth index and are hence the most equipped households. The quintiles are calculated from the entire population of households in Jordan, including Iraqi, Jordanian and other households.

## Characteristics of Iraqi households

The first part of the analysis will focus on the characteristics of Iraqi households residing in Jordan.

### Background characteristics

The Iraqi population in Jordan is an urban population. The vast majority of Iraqi households live in Amman governorate. Poor households more often live outside of Amman; this is also the case for the households that arrived in Jordan before 2003.

About one in five households are female headed; female headed households are more often found among poorer households and among households where the education of the household head is relatively low.

The distribution of households according to the religion of the household head shows that most Iraqi households are headed by a household head that identifies with the Sunni affiliation of Islam; more than 60 percent of the Iraqi households in Jordan belong to the Sunni tradition. Other large groups with concern to religious affiliation are Shi'a (about 18 percent), about 15 percent of the Iraqi households are headed by Christians and the remaining five percent of the Iraqi households are headed by people that characterize themselves as belonging to "other religions affiliations" particularly Sabean and Yedizis.

Two of three Iraqi households have children under the age of 18 years as members. The average size of an Iraqi household in Jordan is 4.1 persons. Generally there is relatively little crowding in Jordan, this is particularly true among Iraqis. We have calculated that the

average number of people per bedroom<sup>2</sup> is 2 for the Iraqi households, even among the poorest household the number of people in sleeping rooms only reach 2.4. (As a comparison: the average Jordanian household has 2.5 persons per sleeping room).

### Dwellings and ownership

Even if the Iraqis in Jordan may have come on a relatively temporary basis, 25 percent of the households own the dwelling where they are currently residing. The remaining 75 percent rent their dwelling. The percentage of ownership is substantially higher among the households in the wealthiest segments of the population. Table 1 shows that as many as 60 percent of the households in the highest wealth group own their dwelling, whereas only 1 percent of the poor households do.

*Table 1: Dwelling and ownership*

	Owned	Without payment	For work	Rented	Total	Sample size
<b>Total</b>	25.4	1.0	0.6	73.0	100	1690
Lowest wealth	1.1	1.6	1.1	96.2	100	306
Low wealth	4.5	1.4	-	94.1	100	287
Middle wealth	9.8	1.0	1.6	87.6	100	243
High wealth	21.5	1.0	0.2	77.3	100	230
Highest wealth	59.9	0.4	0.3	39.5	100	624

The median monthly rent for households that rent their dwelling is 179 JD, with large variations between different groups in the population.

### Infrastructure

The population of Iraqis in Jordan is almost exclusively urban and hence most of them benefit from the infrastructure in the capital city of Amman and other large cities. This is also reflected in the results from the survey where we see that almost all households are connected to the public electricity network, the water network and the sewage network.

Drinking water is obtained from the public water network by one in every three households, whereas the rest of the households rely on buying bottled water for drinking. The use of bottled drinking water is a choice by the household more than a necessity since almost all households are connected to the water network.

Seventy-five percent of households have toilet facilities that are connected to the public sewage network, about 18 percent have ventilated improved pit latrines, improved ventilated pit latrines are particularly common among the poorer segments of the population.

<sup>2</sup> One of many standardized indicators for the degree of crowding in a household

## Wealth and income sources

Households were asked to indicate if they possessed a variety of specified commodities/durables. In generally Iraqi households in Jordan have a high number of durables and they are relatively well equipped.

*Table 2: Percentage of households that possess a given durable*

Refrigerator	94.6
Freezer	11.5
Gas/electric oven (large)	69.0
Gas cooker (small)	33.7
Electric washing machine	85.9
Television	97.8
Satellite antenna	93.4
Video/DVD player	20.9
Ordinary telephone line	48.1
Heater on electricity or gas	58.4
Diesel heater	61.4
Solar heater for water	7.4
Personal computer	45.8
Internet connection	26.3
Sewing machine	4.3
Dishwasher	2.8
Microwave oven	24.9

Vacuum cleaner	47.4
Video camera	12.6
Digital camera	17.3
Mobil telephone	97.2
Instrument to filter water	7.7
Private car	32.0
Water cooler	27.7

Since it may be difficult to get a work permit as and Iraqi in Jordan, income from employment is less common among Iraqi household, making other income sources important. The survey shows that Iraqi households in Jordan are highly dependent on transfers as an income source. As can be seen from figure 8 the most important income source for Iraqi households in Jordan is actually transfers from Iraq, 42 percent of all Iraqi households in Jordan are receiving transfers from inside Iraq. Other important income sources are employment, self employment and transfer incomes from a third country.

Figure 1 : Income sources for Iraqi households

The type of income sources that households depend on varies between the different sub groups of Iraqi households. The poorest households are more dependent on income from employment, whereas the more wealthy households have a higher dependency on income from self employment and on transfers from Iraq. The middle wealth groups are the ones that have the least income from employment and are hence the most dependent on transfers from outside the household.

Table 3: Income sources broken down on wealth and religious affiliation

	Employment income	Income from self-employment	Property income	Interest income	Transfer income within Jordan	Transfer income from Iraq	Transfer income from outside the Kingdom (not Iraq)	Other income
<b>Total</b>	<b>40.7</b>	<b>24.3</b>	<b>5.4</b>	<b>4.4</b>	<b>11.3</b>	<b>41.7</b>	<b>22.3</b>	<b>4.5</b>
Lowest wealth	48.4	18.1	1.1	0.9	21.9	26.5	24.6	8.6
Low wealth	54.2	9.9	2.7	1.1	14.4	33.7	23.1	6.1
Middle wealth	35.7	15.7	2.9	2.2	11.6	49.2	25.4	1.6
High wealth	35.2	19.8	9.4	4.3	8.3	51.0	23.1	6.3
Highest wealth	31.5	41.4	9.4	9.3	3.7	50.3	19.0	1.4
Sunni	38.6	27.4	6.1	5.5	12.1	50.4	18.8	4.4
Shia	48.5	33.5	4.2	3.2	5.4	31.6	13.2	1.6
Catholic	31.1	9.5	3.4	4.6	5.5	40.0	45.3	5.0
Orthodox	28.2	13.1	5.5	-	19.4	25.0	50.2	6.4
Protestant	18.6	-	-	-	-	36.6	55.2	44.8
Nasatra	7.3	-	-	-	-	36.4	63.6	36.4
Sabeian	12.4	4.5	2.5	-	7.4	33.6	58.9	6.0
Yezidis	-	-	-	-	-	100.0	100.0	-
Others or not stated	39.0	14.0	4.5	-	4.9	34.3	30.6	1.9

## Investments

Iraqi households currently residing in Jordan have investments both in Jordan, in Iraq and in third countries. Having investments is strongly correlated with the household's economic

status. Nevertheless, there are also households in the lowest economic categories that have investments. The highest percentages of investments are in Jordan where 23 percent of all Iraqi household have made some form of investment. As can be seen from table 3, forty percent of all the households in the highest wealth groups have investments in Jordan.

*Table 4: Investments broken down on wealth and religious affiliation*

	In Jordan	Outside Jordan	In Iraq
<b>Total</b>	<b>22.5</b>	<b>15.1</b>	<b>13.5</b>
Lowest wealth	16.8	2.5	2.2
Low wealth	8.5	3.1	2.6
Middle wealth	12.8	15.4	15.1
High wealth	17.9	19.4	17.6
Highest wealth	39.2	28.2	24.8
Sunni	25.4	18.6	16.7
Shia	31.6	14.4	13.5
Catholic	10.0	13.8	10.7
Orthodox	8.9	4.6	4.6
Protestant	-	-	-
Nasatra	-	-	-
Sabeen	2.2	3.8	3.8
Yezidis	-	-	-
Others or not stated	14.0	7.4	7.4

With regard to religious affiliation, we find that the households that belong to the Moslem religion have more investments both in Jordan, Iraq and in a third country. This may be correlated with the fact that Moslem households are wealthier than households belonging to other religious traditions and hence it is more the money than the faith that determines the willingness and ability to invest.

## Characteristics of individuals

The second part of the analysis will describe the individual characteristics of the population of Iraqis residing in Jordan. The presentation of data will start with demographic background and composition of the population, continuing with how long they have been in Jordan, their status and the plans they have for the future. The description will continue with a focus on the personal resources such as health, education and economic characteristics.

### Demographic distribution

#### *Gender*

The distribution of gender in the Iraqi population is relatively equal; even though we see that there are somewhat more women than men in the Iraqi population in Jordan. Within certain subgroups we find larger difference between the genders, but on average there is a small overweight of women in the Iraqi population in Jordan, this is particularly true for the middle aged part of the population (25-60).

#### *Age*

The Iraqi population is on average older than the Jordanian population, the mean age for Iraqis is 29.5 years whereas it is 24 for the Jordanians.

The majority of the Iraqi population is 25 years of age and above (56 percent), 26 percent of the population is below 15 years of age and the remaining 18 percent are between 15 and 24 years of age.

#### *Nationality, citizenship, religion and ethnicity*

Respondents were classified as Iraqis in the survey if they stated that their nationality is Iraqi, regardless of their official citizenship. The survey showed that 86 percent of those that classified themselves as Iraqi nationals also held an Iraqi passport. About 13 percent of the respondents that classified themselves as Iraqi nationals say that they carry a Jordanian passport.

The Iraqi population in Jordan consists of several different religious traditions, the majority of the Iraqis are Moslem, but there is also a rather large group of Christians Iraqis.

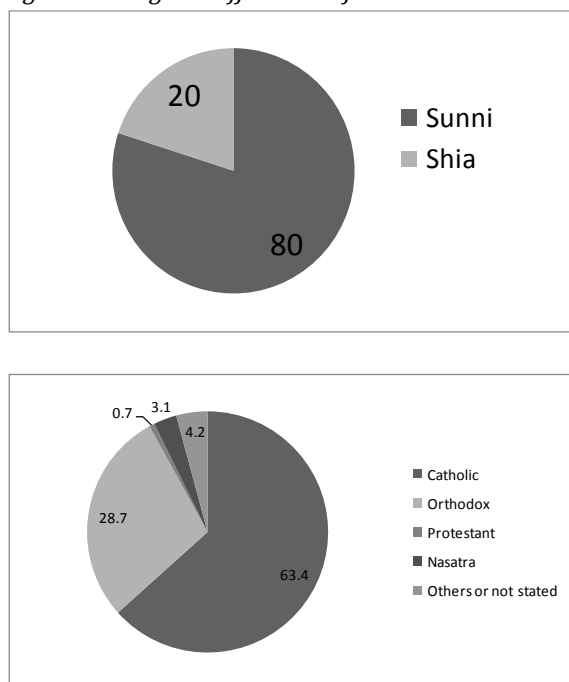

Every eight in ten Iraqis in Jordan are Moslems, the Christians account for about 13 percent, and the remaining three percent is composed of people that belong to other religions such as Sabean and Nasatra. Religious affiliation is relatively evenly distributed across most background variables, but there is a clear trend with concern to religion and economic status. As shown in Table 5, Moslems more often belong to the wealthiest segments of the population whereas people with "other" religious affiliations more often belong to the poorer segments of the population.

Table 5: Religion and wealth status

	Moslem	Christian	Other
<b>Total</b>	<b>84.8</b>	<b>12.7</b>	<b>2.5</b>
Lowest wealth	83.2	9.6	7.2
Low wealth	74.5	21.9	3.6
Middle wealth	72.3	24.6	3.1
High wealth	88.6	10.9	0.6
Highest wealth	92.4	7.5	0.1

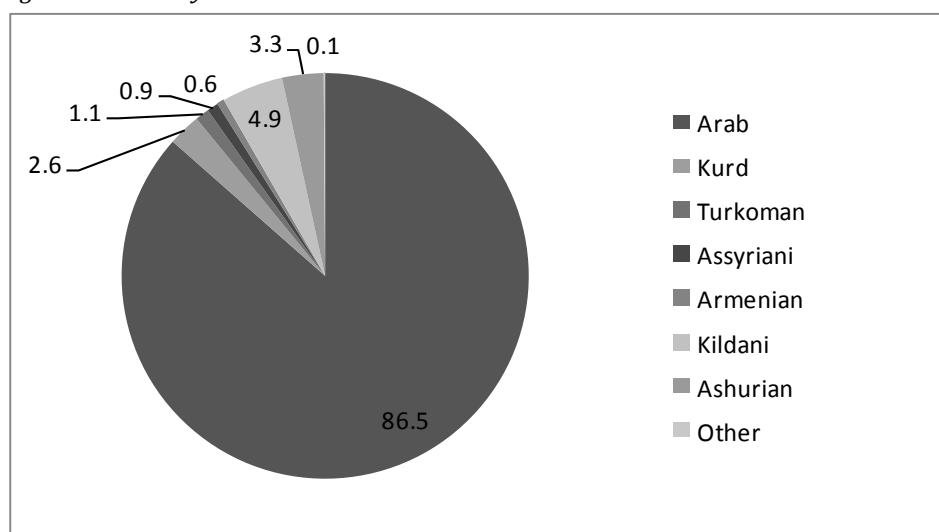

Within the main religious groups (Moslim, Christian and other) people belong to different traditions. Within the Moslim group, 80 percent belong to the Sunni tradition and 20 percent belong to the Shi'a tradition. Among the Christians, the majority belongs to the Catholic tradition; still more than one in four say that they are believers of the Orthodox tradition.

Figure 2: Religious affiliation of Moslims and Christians

The majority of the Iraqis in Jordan say that they are Arabs (87 percent), about five percent classify themselves as Kildani, three percent as Ashurian and three percent as Kurds. Several other ethnicities are represented with less – or around one percent of the population.

Figure 3: Ethnicity

### Place of origin

The most affected areas in Iraq after the escalation of violence and occupation are the central parts of the country and the areas in and around Baghdad. This is also reflected in the population of Iraqis currently residing in Jordan. Seventy-six percent indicate that they came to Jordan from Baghdad; this is particularly true for the population with high personal and material resources (education and wealth). An indication of the high level of personal resources among the people that have come from Baghdad can be seen in that 93 percent of those with a university degree (Bachelor or higher) indicated Baghdad as their last place of residence in Iraq. Few other governorates in Iraq are home to the population of Iraqis currently residing in Jordan even though we find that about seven percent indicate they come from the governorates of Basrah, three percent comes from Al Anbar and two percent comes from Ninewa.

### Time of taking up residency in Jordan

Jordan has experienced several flows of Iraqi people coming to the country, a number of these left the country to go to a third country or to go back to Iraq, but there is also a large Iraqi population that are still residing in the country. About 23 percent of the Iraqi population currently residing in Jordan was here before 2003, the remaining 77 percent came during the years from 2003 until May 2007 (time of conducting the survey). As shown in figure 4, the majority of these started their residency in Jordan in 2006. Entry and exit data from other sources show that the largest number of Iraqis entered Jordan in 2005, still the data from this survey indicate that most people started their residency in 2006, the findings can hence be taken as an indication that the large number of Iraqis that entered Jordan in 2005 have resettled in other countries or moved back to Iraq. The data also show that a low percentage of Iraqis started their residency in 2007, emphasizing the fact that fewer have entered the country this year.

With concern to the religious affiliation of Iraqis residing in Jordan it is clear that the relative increase has been largest among the Moslem population, particularly among those that belong to the Sunni tradition.

Figure 4: Start of residency in Jordan and religious affiliation

The distribution of start of residency across other background variables indicates that there are few differences between population groups.

Respondents indicate two main reasons for staying in Jordan; the most important is the difficult security situation in Iraq. About half of the Iraqi population gives this as their main reason for being in Jordan. This is particularly true for the non-Moslim part of the population where more than 65 percent state security reasons as their main reason for leaving Iraq. Men are also more likely than women to give this as their main motivation to stay in Jordan.

The second most important reason for Iraqis to stay in Jordan is family reunion. Thirty-eight percent of all Iraqis in Jordan indicate this as their main reason for residing in the country. Family reunion is an important reason to stay in the country particularly for women and children and among the wealthy part of the population. The third most important incentive for residing in Jordan among the Iraqi population is that they came for work; this reason is more often given by the male part of the population and among those with high education.

### *Validity of permits*

All foreigners should have a valid permit to stay in Jordan; 56 percent of the Iraqi indicates that they have such a permit and that it is currently valid. There are large differences between the population groups in the survey with concern to the possession of valid permits. Among the wealthiest population, close to 80 percent say that they have a valid permit, whereas this is only the case for 22 percent of the poorest part of the population. To have a valid permit is also more common among Moslems than those who belong to another religion, and among those with high education.

Whether or not a person has a valid permit is a sensitive issue and admitting that one does not possess such permits may be perceived as a risk to some informants, we are aware that respondents, due to the perceived risk of not having a valid permit, may report that their permit is valid even though it might have expired.

### *Registration with UNHCR*

UNHCR is offering Iraqis the possibility to register with the agency. The survey finds that 35 percent of the Iraqis in Jordan have chosen to be registered with UNHCR. Such registration is more common among the Christian part of the population and among those in the poorest population segment. This can be illustrated by that only about 15 percent of those in the highest wealth group have registered, whereas more than 50 percent in the lowest wealth group have registered with UNHCR.

### *Plans to go to a third country or plans to go back to Iraq*

Jordan is being used as a country of transit by many of the Iraqis that have chosen or have been forced to leave Iraq, one in every five Iraqi have concrete plans to emigrate to a third country. A wish to go to a third country is found in all parts of the population, but it is particularly true for the poorer part and the ones that belong to non-Moslem religions.

Even though people may have concrete plans to leave Jordan for a third country, the expected time that they will leave is unclear to most. Around 40 percent say that they will leave within a year, still; close to half of those that plan to leave say that the exact time of emigrating is unclear to them.

There is a wish among the Iraqi population to go back to Iraq, about 40 percent of the Iraqis in Jordan express that they have plans to return to their country, but with the uncertain security situation in Iraq at the moment more than 95 percent of those that wish to return say that they will not return to Iraq before the security situation allows for it. Plans to go back to Iraq are particularly seen among the Iraqi population with high levels of resources, economically and with concern to high education, among the Moslem population and among the ones that came in 2006 and 2007 (late arrivals).

## Health

The Iraqi population in Jordan has a somewhat higher prevalence of chronic diseases than the Jordanian population. The differences are not very large, but there is a consistent reporting of higher percentages of chronic illness across most background variables. Of the total population of Iraqis, 11 percent report to suffer from a chronic illness, whereas eight percent of the Jordanian population reports such conditions.

About seven percent of the Iraqi population reported to have been suffering from acute illness the last 6 months; this is the same percentage as for the Jordanian population. Close to all those that suffered from an acute illness contacted someone outside the household for consultation (93 percent). The Iraqi population most often utilizes the private sector health care system when they need medical care, two in three (66 percent) consulted a specialist, about 23 percent went to a general physician and the remaining 11 percent sought help from other sources. There is little variety among the population groups as to what kind of consultation they would seek in case of acute illness. The extensive use of private health services among Iraqis is also indicated in the findings that more 90 percent of those that

spent one or more night in hospital over the last six months did so in a private hospital, only eight percent was in contact with a public hospital.

*Table 6: Health insurance*

	Valid health insurance	No valid health insurance	Total	Sample size
<b>Total</b>	<b>13.0</b>	<b>87.0</b>	<b>100</b>	<b>6,633</b>
Lowest wealth	3.9	96.1	100	986
Low wealth	10.2	89.8	100	1,020
Middle wealth	12.2	87.8	100	913
High wealth	10.2	89.8	100	960
Highest wealth	19.7	80.3	100	2,754

Only about one in eight Iraqis in Jordan has a valid health insurance in the country; whether the insurance is private or governmental. Even though the lack of health insurance is seen across most population groups it is particularly prevalent among the poor. It is also worth to note that only ten percent of the children younger than 6 years and only 6 percent of the people above 65 years have any form of insurance.

## Education

### *Completed education*

The educational level among the Iraqi population in Jordan is very high, close to half of the adult population (16 years and older) have completed an education on Bachelor level or higher (46 percent), men are somewhat overrepresented with concern to the highest educational group, but women are also very well educated, 42 percent of all Iraqi adult females in Jordan have a university degree. As shown in figures 5 and 6 the educational distribution between the genders is relatively similar.

*Figure 5: Educational level among Iraqi men 16+*

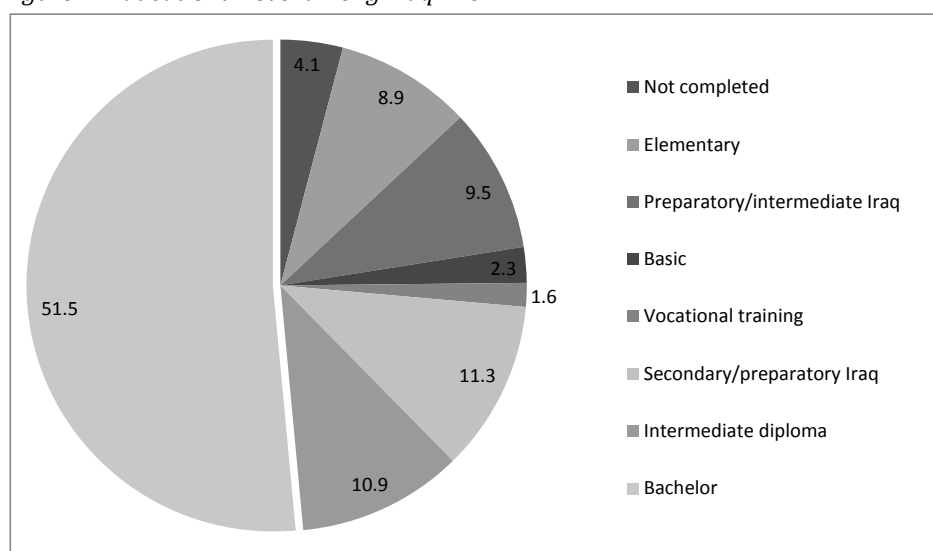

Figure 6: Educational level among Iraqi women 16+

High educational level is particularly common among the Moslem part of the population, both among persons belonging to the Shi'a and Sunni tradition, even though the level is somewhat higher among the Sunni population where more than 50 percent of the total grown-up population belong to the highest educational group. Education and wealth goes together, the higher wealth the higher education. It is worth noticing that the educational level among the oldest age group is very high in the Iraqi population in Jordan (50 percent).

#### *Enrollment among school aged children (6-17 years old)*

The survey finds that there is a group of Iraqi children who are not attending school even though they are within school age. Of the total population of Iraqi children in the age between 6 and 17, 78 percent are currently enrolled in school (including both public and private education facilities). This is much lower than the Jordanian enrollment rates that reach 93 percent of the same age group.

The lack of enrollment is particularly prevalent among certain parts of the population. Table 3 shows that only about sixty percent of the Iraqi children in the poorest wealth group are enrolled in school, enrollment rates are also low among the non-Moslem population. The survey also shows low enrollment among those that took residence in Jordan recently; this may be due to difficulties of enrollment as they may have arrived in the middle of a school year. There was also some confusion during the school year 2006/2007 as to whether Iraqi children without a valid permit to stay in Jordan were allowed to register for schools. The majority of the respondents aged 6-17 who are not in school say that they are not attending school because the family is displaced due to war, or that they cannot afford to pay for schooling for the children.

Of the Iraqi children who are enrolled in school; about three in four attend private schools whereas the remaining one in four are enrolled in governmental schools, among Jordanian children 20 percent attend private schools and 80 percent attend governmental schools.

Private school is particularly common among the wealthier parts of the Iraqi population, but enrollment in private schools is also found among the very poorest parts of the population. The reasons for the high prevalence of private school attendance among Iraqi children may be many; the parents may be sufficiently well off financially so that they chose to send their children to private schools, it may also be easier to find space for their children in private schools than in government schools who are already under pressure from an increased number of Jordanian students.

Table 7: Enrollment of Iraqi children 6-17 years old

		Current enrollment status			Total	Sample size
		Yes, currently enrolled	Yes, was enrolled before	No, has never been enrolled		
<b>Total</b>		<b>78.2</b>	<b>19.1</b>	<b>2.6</b>	<b>100</b>	<b>1,565</b>

	Batchelor +	86.2	12.1	1.7	100	787

n=all Iraqi respondents 6-17 years

The cost of sending children to private schools are high, the average Iraqi child in private school pays 1613 JD per school year whereas the average cost per school year for governmental schools are 383 JD. One should expect that as Iraqi families are running out of savings they will try to move their children from private to governmental schools increasing the stress on the Jordanian governmental education system. The development in the school

registration for Iraqi children in Jordan during the autumn of 2007 indicates that this shift is happening.

### Employment

More than 70 percent of the Iraqi population in Jordan is in working age (15+); of these, about 30 percent are participating in the work force. The participation rate is low (as a comparison, Jordanian population in this survey has a participation rate of about 40 percent). It is particularly low for women among whom only about 14 percent are actively participating in the labor market. The rate is substantially higher for men, but still only about every second Iraqi man in working age participate in the labor force.

Figure 7: Labor force status Iraqi

Of the Iraqi who has employment, about 60 percent work as employees for someone else, this is particularly true for the few Iraqi women who work; 70 percent of them are employed by someone else. To be an employer oneself is more common for men, about 30 percent of the Iraqi men who participate in the work force report that they are employers. Close to 25 percent of employed Iraqi women and thirteen percent of men are self-employed. Paid employment and self employment is more common among the poor, being an employer is more common among the high wealth groups.

About one in ten of Iraqis with current employment would like to change their job if they could, the main reason given by most is that the income in the current job is insufficient; another important reason stated is that "the current job does not fit my qualifications". The poorer part of the population emphasize bad working conditions as important reasons to change jobs, whereas the argument regarding qualifications is more often used by those with high socio-economic status and high education.

If people are not actively seeking employment they will not be categorized as unemployed. Measures of people that have stopped looking for a job even though they would like to work are often used as an indication of the level of discouraged workers/underemployment. The majority of the respondents that wanted to work but had stopped looking for work told us

that they considered it impossible to get a job in Jordan without a work permit. This is particularly true for the respondents in the low wealth group. Another important reason not to look for work is the perception that there are no suitable jobs available.

### *Economic status for those who are not active in the work force*

The majority of the economically inactive population states their economic status as housewives, as shown in figure 8, close to four in every five women who are not working indicate this as her status.

Figure 8: Economic status for economically inactive

For men, the most common status is to be a student; still about one in every four male in this population said that he is currently living from savings. This is a very high population and a clear indication that a substantial part of the Iraqi population in Jordan makes use of their savings to get by, indicating that their means of getting by are not sustainable in the long run.

## Reproductive health

Twenty-five percent of women between the ages of 15 and 50 have given birth in Jordan during the last 5 years. Nearly all of them sought medical aid during the pregnancy and gave birth with the help and supervision of qualified assistance. About three in four of all births took place in private hospitals.

## Technical aspects of the survey

---

The Survey of Iraqis in Jordan was designed to

1. Estimate the number of Iraqis that at the time of the survey reside in Jordan.
2. Describe the main characteristics of the Iraqis

The survey focused on presenting estimates for the whole of Jordan, rather than for governorates or for other geographic sub-domains.

### Sampling

The survey had a relatively complex sampling plan, intended to generate estimates with small sampling error. The survey of Iraqis in Jordan is a household survey, with a questionnaire that tried to elicit information about both households and individuals. The selection of households was made in two steps: first selecting an area where the household lived, and then selecting households within each selected area.

The areas in question are enumeration areas from the 2004 population and housing census of Jordan. These areas generally contain from 60-120 households, and their borders are well defined on maps. There are two main set of maps: First, the location of each enumeration area has been entered into a GIS system, and this defines the location in relation to streets, roads or natural features. Secondly, a sketch map has been drawn for each enumeration area. The sketch map shows the location of each house. With few (and for this purpose irrelevant) exceptions all of the geographical extent of Jordan is covered by an enumeration area. For example, the enumeration areas include a garage/taxi stand where in 2004 many Iraqis could be found either waiting for transport to Iraqi, waiting for the arrival of relatives or simply not having anywhere else to stay.

When enumeration areas had been selected, each of the areas was mapped and listed. The existing map of the enumeration area was used as a point of departure. Then any new houses found were added to the map, and any houses that had been torn down since the census were removed. Then all households that could be found in the houses were listed. The listing was carried out regardless of the type of house. That is, if a house turned out to be a petrol station, a mosque, or a factory, the enumerator would still visit it in order to determine if any households resided there. Similarly, temporary dwellings (e.g. tents) would be included in the listing.

In addition to listing the presence of households, the enumerator would also inquire about the number of household members, and the number of Iraqi household members. If no-one could be found in a household after three attempts of contact, neighbors would be asked,

and if they could not supply information the household would be marked as existing, but missing information.

In each enumeration area all Iraqi households up to 10 would be interviewed. If more than 10 Iraqi households were present 10 would be selected randomly. In addition to interviewing Iraqi households identified during the listing, two interviews with randomly selected other households would be made in each enumeration area. This was partly to have a basis for comparison with the Jordanian population, and partly to assess the amount of misclassification during the mapping and listing phase.

While the mapping, listing and identification of the Iraqis within each enumeration area are crucial for the accuracy of the survey, the selection of the enumeration areas themselves was critical as well. Here the survey departed somewhat from ordinary household surveys. Most household surveys do not focus on the size of the population at all, but rather on the characteristics. When the size of the population is the overriding concern a sampling scheme designed for that purpose is more appropriate, rather than a general, "one-size-fits-all" design.

A characteristic of Iraqis in Jordan, and indeed of many population groups in the Middle East and elsewhere is that they tend to live clustered, rather than homogeneously spread out over the whole country. This is partly related to cultural preference, and partly stems from the sheer mechanics of migration: it is easier for a new entrant to move in close to relatives or friends who can help in finding housing and services.

The clustering is both a drawback and a benefit for the survey. In the absence of information about the clustering, one might risk, particularly with a small sample, to draw mainly enumeration areas without Iraqis, thus underestimating the number of Iraqis. One could also be "lucky" and draw many enumeration areas with Iraqis, and thus make a too large estimate. In general such a situation leads to high uncertainty about the estimate.

There was, however, information available on the distribution of Iraqis in Jordan in the 2004 Census, and although the information in absolute terms was out-dated, it was considered of considerable use as regards the distribution of Iraqis in Jordan. The 2004 Census shows clearly that the majority of Iraqis live in Amman, with additional concentrations in Karak and Irbid.

If one is interested in a particular estimator, such as the total number of Iraqis in this case, it can be shown that an optimal sample is one that allocates the sampling units proportional to the standard error in each stratum of the sample. Thus, Jordan was divided into different strata, such as governorates and districts, and if the variability of the number of Iraqis as recorded in the 2004 census was large, then a large proportion of the sample was allocated there. The idea can be illustrated as follows: A population is divided into two groups of households, one group with high income, but where everyone has more or less the same, and another group where income is very variable. In order to get a good estimate of the total income, more households would be needed from the group with variable income, than the group with uniformly high. In the extreme case, one might argue that if all households in the

group with high income had the same income, a selection of only one household would be representative.

The optimal allocation directs most of the sample of Iraqis to Amman. Within Amman, the survey sampling was carried out exploiting the optimal allocation strategy a bit further by dividing the sample into phases. Thus, first a selection of 200 enumeration areas was carried out, divided into 8 strata. Then the standard error of the 2004 distribution of Iraqis was calculated, and the sample was allocated according to that. The standard error of the new sample was calculated, and another allocation of enumeration areas to strata was carried out. Then the process was repeated a third time, based on the second sample.

The sample outside of Amman was also allocated optimally, but an optimal allocation based on the 2004 Census actually results in some governorates receiving very small sample takes. In order to guard against the possibility that Iraqis had moved into areas where they had not been in 2004 some governorates and districts were assigned more enumeration areas than they should have had based on the optimal allocation.

The sample selection in Amman followed two strategies. The strata in Amman were of two types: There were four strata where presence of Iraqis had been recorded in the enumeration areas in 2004, and four strata where that was not the case. In those with Iraqis, the selection of enumeration areas was made so that the probability of selection was proportional to the number of Iraqis in 2004. The reason for doing this was that when the probability of being selected is correlated with what one wants to estimate (here the number of Iraqis in 2007) a substantial reduction in sampling variability is achieved. The assumption here was that the enumeration areas that had few Iraqi residents in 2004 would be likely to have few in 2007 as well (but perhaps more) and that those that had many in 2004 also would have many in 2007. In strata where there were no Iraqi residents in 2004 sampling of enumeration areas was made so that the probability of inclusion of an enumeration area was based on the number of households in the area, as is common in household surveys.

The actual sample selection outside of Amman followed a rather different strategy, based on the assumption that Iraqis tend to cluster in neighborhoods. The selection started out with a standard selection of enumeration areas with probability proportional to the number of households in each area. Then if an enumeration area turned out to have two or more Iraqi households, the neighboring enumeration areas were also selected, mapped, and listed. If any of the neighbors turned out to have two or more Iraqi households, then the neighbors to those were mapped and listed and so on. The strategy, termed adaptive cluster sampling, is quite efficient for estimating the size of a population.

In total a 1000 enumeration areas was planned to be surveyed in the sample. In Amman 600 was planned for and also surveyed, while the remaining 400 was allocated to the rest of the country. The initial sampling of the governorates outside of Amman allocated 321 enumeration areas, while the adaptive cluster sampling expanded the sample with 25 more enumeration areas (although a larger number was mapped and listed).

## Fieldwork

Fieldwork consisted of three distinct phases: Mapping and listing, interviewing and quality assurance. Mapping and listing started April 21, 2007 and due to the nature of the survey continued for nearly the complete survey period. The interviewing for the survey started May 1, 2007 and all but 16 interviews was completed by May 31. In total 3787 household interviews were attempted, split nearly equally between Iraqi and non-Iraqi interview attempts. Of the interviews attempts, 3439 was completed, yielding a completion rate of 92 percent. Households in the Iraqi sample had a slightly lower completion rate (89 percent) than non-Iraqi households (93 percent), but in general non-response was not a large issue.

*Figure 9: Distribution of interviews during the fieldwork period (Weeks from May 1 to June 14, 2007)*

## Quality management

The number estimated from the survey depends partly on the sampling scheme, and partly on the execution of the fieldwork. Since the sample is a probability sample, unbiased estimates of the population covered by the sampling frame can be made. The estimates are associated with sampling error, but these are relatively small.

For a survey such as this, errors that are not directly related to the sampling are generally more important. Since many Iraqis are in Jordan without a valid residence permit, it may be expected that many would not reveal themselves. Moreover, survey mapping and listing is intrinsically difficult, and easily yield too low estimates. Such effects are well illustrated by the normal surveys (such as the labor force survey) that the Department of Statistics in Jordan carries out, that yield estimates of the number of Iraqis that are well below those presented here.

During and after the fieldwork several measures were taken to ensure proper mapping and listing of households. Some of these were carried as a matter of ordinary survey practice, but perhaps employed more diligently, while others were responses to particular queries that

were raised by preliminary analysis of the listing data as they were obtained from the field. We will go through such measures in turn:

### Anonymity of respondents

In order to protect the respondents Department of Statistics and Fafo together decided to deviate from some of the standard survey practices of the Department of Statistics. Two main steps were taken. First, reporting names of the household head or family members were voluntary. Second, telephone numbers of respondents were not noted down. These measures made it somewhat more difficult to carry out some post-fieldwork checks (for instance to phone the respondent in case errors were found during data entry), but may have increased the quality of response.

### Training of mappers and listers

The mappers and listers were specifically trained for the task. Most were experienced mappers and listers that had worked with the Department of Statistics previously.

### Supervision

Teams of three listers had each assigned a supervisor who verified that the work was carried out correctly.

### Field checks by Fafo

Fafo staff was present throughout the fieldwork, and would carry out spot checks and partial relisting in random locations. Only a few minor errors were found during such checks.

### Complete relisting of 10 enumeration areas

Department of statistics carried out a complete relisting of 10 randomly selected enumeration areas. No major divergences from the original listings were discovered.

### Random checks of enumeration areas that had Iraqis in 2004

During the mapping and listing it was observed that many areas outside of Amman that in the 2004 census had been found to have Iraqis residing now had few. Also, it was a concern that the sample had somehow returned too few clusters with Iraqis outside of Amman. Therefore a random sample of 55 enumeration areas outside of Amman was drawn, with five enumeration areas in each of the 11 governorates. Particular care was then taken to ensure proper listing of the clusters. The results revealed fewer Iraqis (46) in 2007 than in 2004 when the number was 169. These enumeration areas were not used for other purposes than quality control, i.e. they were not entered into the estimation of Iraqis in Jordan since the sample was intentionally biased.

### Collection of narratives from enumeration areas that had many Iraqis in 2004, but none in 2007.

In some cases the survey team found that enumeration areas with large number of Iraqis in 2004 were found to contain none or very few at the time of the survey. One such case, referred to above, was that of a taxi stand/bus stop in Amman where Iraqis used to congregate in 2004, either waiting for transport to Iraq, waiting for relatives to arrive, or

simply having no other place to stay. Few were found in this area in May 2007 as road traffic to Iraq from Jordan has more or less ceased because of the security situation.

In addition to this and a few other enumeration areas where the reason for changes in the number of Iraqis had been determined in the course of the ordinary quality management procedures, 10 enumeration areas were selected purposively, and a team of interviewers were sent there. Their task was to elicit from neighbors, officials, shop-owners or others with knowledge of the area what the story about the “missing Iraqis” was. These stories can roughly be categorized in three groups. First, some Iraqis had left for Iraq, particularly after the execution of Saddam Hussein. Second, some, especially poor Iraqis, had left for Syria, apparently expecting lower living costs there. Third, some had left for Amman, or other places in Jordan, or third countries.

### “Closed” housing units

A particular feature of the housing situation in Jordan is the large number of “closed” housing units, that is houses or apartments that show signs of being inhabited, but where no one can be found at home. The phenomenon is partly due to investments in housing as a form of saving, combined with the fact that Jordanian law makes it difficult to evict people who rent apartments. Moreover, some residents work outside of Jordan for parts of the year, and only return to their dwelling during vacations. In terms of the present survey, a particular problem with these dwellings is that it may be difficult to distinguish a housing unit that is in fact temporarily uninhabited, from a housing unit that is inhabited, but by a family that do not want to open their door for the lister or interviewer, for example because the family is an Iraqi one that is afraid of revealing themselves.

As a general rule in surveys in Jordan such dwelling units are most common in rich areas, reflecting the function of the dwellings as means of investment and saving. In order to determine if the closed dwellings could be related to presence of Iraqis, 15 enumeration areas with many closed dwellings were selected at random. Five of these had been listed as having many Iraqis, five had an intermediate number, and five had none. The survey team then tried to determine the reason for the closed dwelling in each case, and if it was in any way related to presence of Iraqis. No such relation was found.

## Appendix 1: Tables

---

This appendix first presents the tables on household level and then the tables for the individuals. In addition the appendix presents tables on the reproductive health indicators for Iraqi women. The tables are generally broken down by the same background variables.

### Responding population

Most of the tables describe the situation for the Iraqi population in Jordan as a whole, or for particular subgroups. The descriptions of the respondents to the different indicators are given in the footnote to the tables.

Some of the tables describe the indicators for all respondents to the survey, hence including Jordanian respondents and respondents of a third nationality, in these cases it will be indicated in the footnotes of the tables.

The total number of respondents sometimes differs between tables; this is due to missing information for some respondents on some questions.

## **Contents of Household tables**

- 1.1 Area of residence
- 1.2 Gender of household head
- 1.3 Religious affiliation of household head
- 1.4 Time of arrival in Jordan for household head
- 1.5 Employment of household head
- 1.6 Registration with UNHCR of household head
- 1.7 Validity of permit for household head
- 1.8 Children in the household
- 1.9 Type of tenure for Iraqi households
- 1.10 Rent for Iraqi households
- 1.11 Household size for Iraqi households
- 1.12 Number of people per sleeping room
- 1.13 Crowding in sleeping room
- 1.14 Connection to public water network
- 1.15 Main source of light in the dwelling
- 1.16 Main source of drinking water
- 1.17 Toilet facility
- 1.18 Household durables
- 1.19 Household wealth
- 1.20 Income sources
- 1.21 Investments in Jordan
- 1.22 Investments outside Jordan
- 1.23 Investments in Iraq
- 1.24 Economic situation compared to 2002
- 1.25 Lifesatisfaction

## **Contents of Individual tables**

- 2.1 Gender
- 2.2 Age group
- 2.3 Nationality and citizenship
- 2.4 Additional citizenship
- 2.5 Religion
- 2.6 Religious affiliation
- 2.7 Ethnicity
- 2.8 Last place of residence in Iraq
- 2.9 Residing in Jordan since...?
- 2.10 Validity of permits
- 2.11 Main reason for staying in Jordan
- 2.12 Plans to leave Jordan
- 2.13 Expected time of emigration
- 2.14 Plans to go back to Iraq
- 2.15 Expected time of return to Iraq
- 2.16 Registration with UNHCR
- 2.17 Health insurance
- 2.18 Disability or chronic illness
- 2.19 Acute illness last six months
- 2.20 Consultation for the illness
